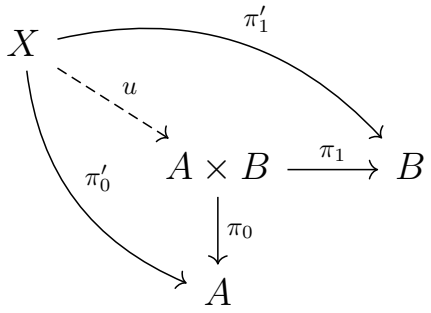
1 Product

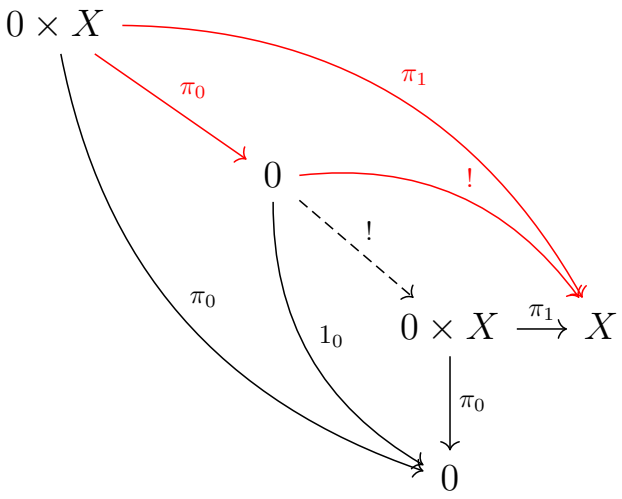
Definition 1.1 (Product)**.** *Let $\mathcal{C}$ a category and $A, B \in \mathcal{C}$, $(A \times B, \pi_0, \pi_1)$ forms a product of A and B where $A \times B \in \mathcal{C}$, $\pi_0 : A \times B \to A$ and $\pi_1 : A \times B \to B$, if for any $X \in \mathcal{C}$ with $\pi_0' : X \to A$ and $\pi_1' : X \to B$, there is a unique arrow $u : X \to A \times B$ such that the following diagram commutes:*



Furthermore, a product of A and B is a limit of diagram:

$$(A \qquad B)$$

One may trying to show that $0 \times X \simeq 0$ by:



However, the red triangle needs not to commutes, that is, the arrow π_0 from $(0 \times X, \pi_0, \pi_1)$ to $(0, 1_0, !)$ may not exist.

Definition 1.2 (Product of Arrow)**.** *Suppose $(A \times B, \pi_0, \pi_1)$ and $(C \times D, \pi_2, \pi_3)$ are two product, and $f : A \to C$, $g : B \to D$. The product of arrow $f \times g$ is a*

unique arrow from $A \times B$ to $C \times D$ such that the following diagram commutes:
